App audit: staff workspace

Date: 2026-11-03. Scope: the logged-in staff workspace on the staging host, role Owner, account Jackson Properties LLC. Method: read-only. Nothing was saved, sent, exported or deleted, and Log out was not used.

---

1. Summary

The app is more mature than the public site: fast (LCP 0.74 s, CLS 0.018, TTFB 134 ms), strong security headers, an accessible mobile drawer, labeled forms and table regions, semantic status tokens and a loaded brand font. Three real defects (items 1, 2 and 3 in section 4) and polish items remain.

---

2. App map

- Entry: public site, then /login. Any app URL without a session answers 307 to /login.
- Shell: sidebar (Dashboard, Maintenance Requests, Appointments, Call Log, Settings, Logout), header (company, property and building selectors, Emma AI, user menu), drawer on narrow screens.
- Dashboard: filters, 6 KPI cards, maintenance performance cards, charts, recent calls, Attention Required.
- Maintenance Requests: summary, pipeline by stage, filters, List, Board and Group by category views, Export CSV, detail page per request.
- Appointments: Overview (scorecards, Day, Week and Month schedule) and Pipeline (New to Won), Add appointment dialog, Attention required, Needs a time.
- Call Log: filters and empty state.
- Settings: overview with a setup checklist (17 percent) and 19 pages in six groups.
- Flow diagram: Miro board https://miro.com/app/board/uXjVESDiKo0=/

---

3. What works

- All 5 main routes and 19 Settings routes visited; 18 of 19 Settings pages load; no link leads nowhere.

- All /api calls observed answered 200 (the only 503 was the page request of Resident requests). No console errors.
- Clear breadcrumb, title and description on every screen; useful empty states; honest labels ("Collecting data", "Not connected").
- Dialogs and menus open with focus inside, close with Escape and return focus.
- Landmarks, skip link, aria-current, one h1 per page, labeled fields, wide tables in a labeled focusable scroll region.
- Contrast: of 196 text elements on the Dashboard, only the "—" placeholders fail (#a3a3a3 on white, 2.5:1).
- Responsive at 500 px: no horizontal overflow on Dashboard, Maintenance and Appointments; accessible drawer.
- Performance: TTFB 134 ms, FCP 236 ms, LCP 736 ms, CLS 0.018, 35 KB transferred, slowest API call 581 ms.
- Security headers: CSP with nonce and strict-dynamic, HSTS with preload, X-Frame-Options DENY, nosniff, COOP and CORP, no-store for private pages, 301 from http.
- Design tokens (18) including semantic status colors and a 44 px touch target; Inter Variable loaded.

---

4. What needs fixing

Defects

1. Settings, Resident requests shows "This information could not be loaded". The page request returned 503, and Try again sends no new request.
2. Appointments, Pipeline at 1440 px: heading, Add appointment and "Updated" extend to 1612 px; the button (1329 to 1477 px) is partly off screen and the page does not scroll horizontally.
3. Every page has the same browser title "Mobve | Staff workspace", and all 19 Settings pages use the h1 "Settings".
4. Text size: most content is 11 to 12 px, labels 10 px, 9 px measured at 500 px.
5. Touch targets: about 20 elements per page under 44 px although a 44 px token exists.

UX and polish

6. Full page loads show a blank "Checking legal acceptance..." screen (seen on Appointments; the legal-acceptance call runs on every load).

7. Hover: sidebar background changes to #f5f7f9 only; Delta, Reset filters and Emma AI show no change; no pressed state.
8. Required fields in Add appointment are not marked.
9. Empty KPI dashes in #a3a3a3 (2.5:1).
10. The request detail h1 is the internal code (CALL-0A8DB8A5).
11. Phone numbers are unformatted.
12. The week calendar header is wider than a 500 px screen.
13. call-answering is requested on every page change (about 20 times in the walk).
14. Dashboard and Maintenance show different date ranges without saying so.

Expected in staging

Phone numbers and routing unavailable until provider verification; setup checklist at 17 percent; no usage events; empty call scorecards.

---

5. Scope

- Seen: the rendered app, computed styles, network calls and headers, at 500 px and 1440 px, role Owner, one account with mostly empty data.
- Not seen: the app source code and bundles, the backend, other roles and accounts, populated data. No security code audit of the app.
- Not verified: actions that write data, Lighthouse for the app (the automated tool runs without the session), keyboard-only and screen reader runs.

---

6. Corrections made during the audit

- A first check suggested unnamed controls on Team and access; the check was wrong.
- A request detail error came from a truncated test URL; the real link works.
